

The great advantage of this proposal is it uses pure CO₂ from the air to grow harvestable algae. This is proposed for the most advantageous places for algae growth. That is due to the abundance of sun shine and seawater.. That is in the remote parts of northern Australia. .and hence use the algae for commercial bio diesel production. The CO₂ is obtained directly from the air and seawater directly from the sea.

These are photographs of the photos indicating proof of feasibility of algae production:

Size of algae harvested before processing to bio-diesel or other products.
